

Representative qualitative cases

Facts shown below are direct prediction transitions; causal explanations are intentionally not asserted.

A. LoRA mixed behavior on the same image

QA 107: is there an acute infarction?

GT: yes

Zero-shot: No

LoRA-native: yes

VT1024 / VT512 / VT256: yes / yes / yes

QA 102: is the lesion on the left or right side of the brain?

GT: left

Zero-shot: Left

LoRA-native: right

VT1024 / VT512 / VT256: right / right / right

Observed: infarction presence is corrected, while lesion laterality flips from left to right.

B. Resolution-sensitive anatomy identification

QA 443: what structure lies directly posterior to the appendix in this image?

GT: psoas muscle

Zero-shot: Colon

LoRA-native: the psoas muscle

VT1024 / VT512 / VT256: the psoas muscle / the cecum / the cecum

Observed: LoRA-native / VT1024 answer psoas muscle; VT512 / VT256 answer cecum.

C. Exact-match wording sensitivity

QA 399: what abnormalities are in the lung apices?

GT: nodular opacities

Zero-shot: No abnormality

LoRA-native: nodules

VT1024 / VT512 / VT256: none / nodular opacities / nodules

Observed: native 'nodules' becomes exact GT wording 'nodular opacities' at VT512.

D. Non-monotonic visual-budget response

QA 212: is there a left apical pneumothorax?

GT: yes

Zero-shot: No

LoRA-native: yes

VT1024 / VT512 / VT256: no / yes / no

Observed: native ✓, VT1024 ✗, VT512 ✓, VT256 ✗ for the same QA.
